

**CM-13101**

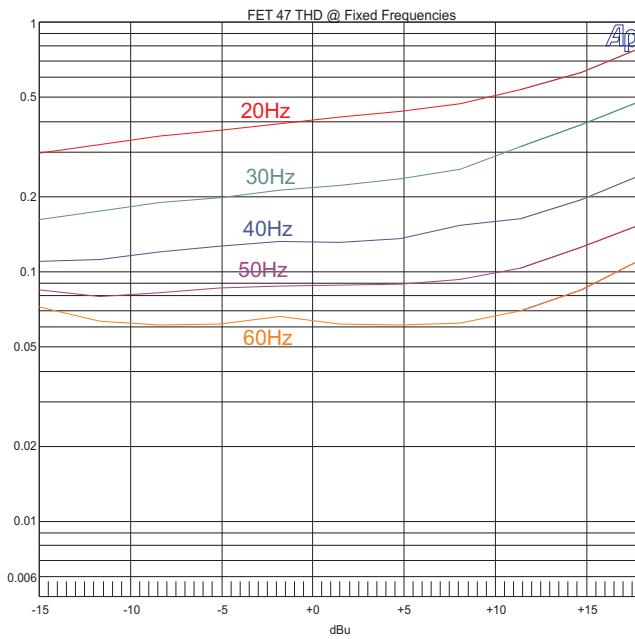

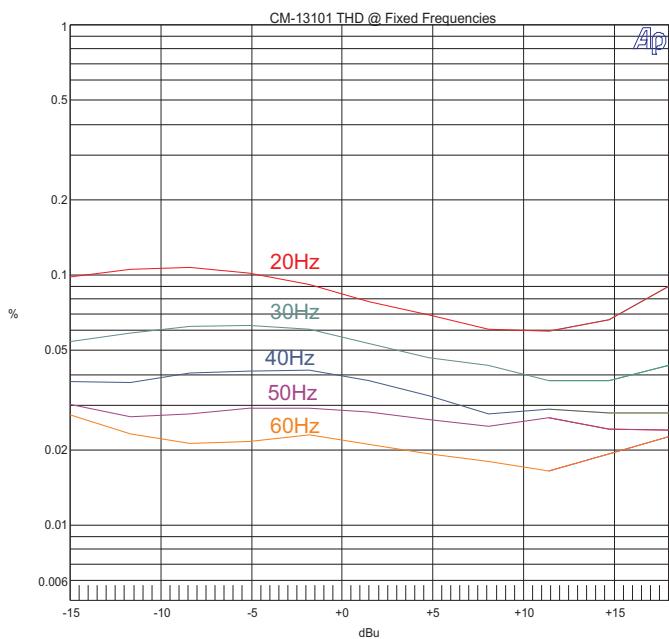

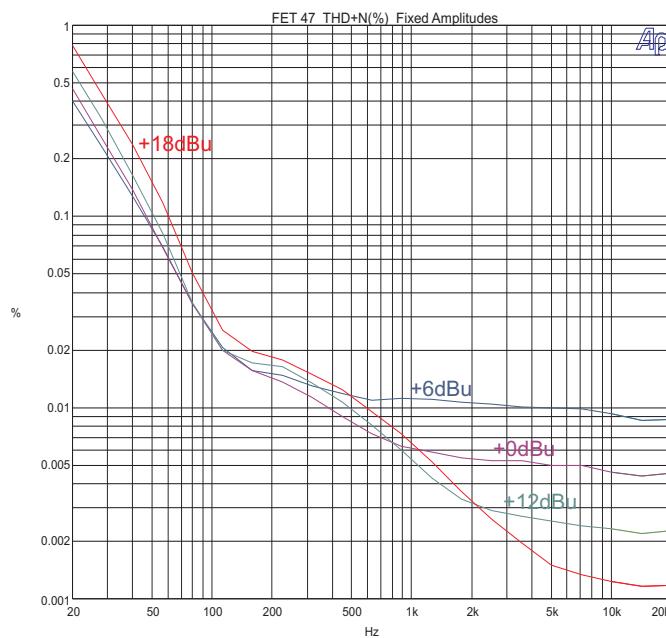

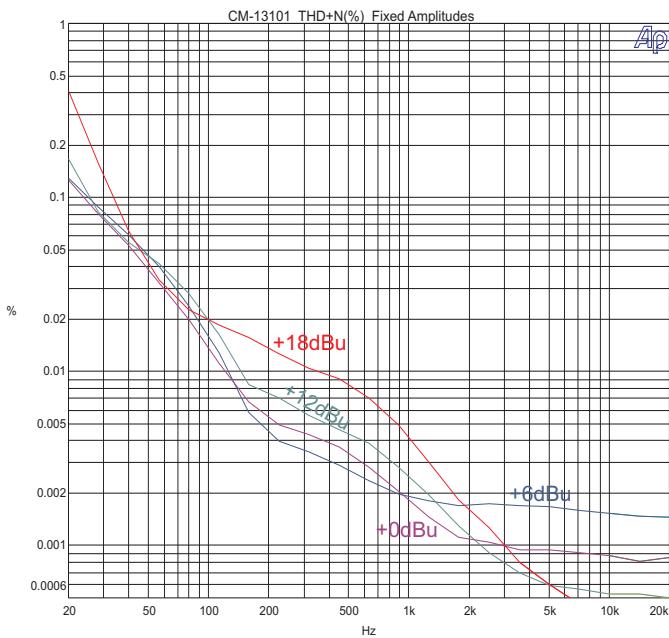

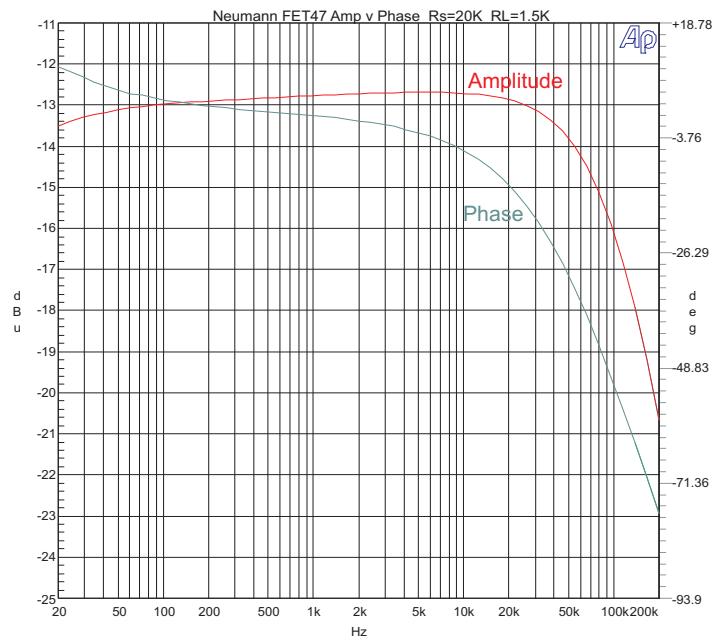

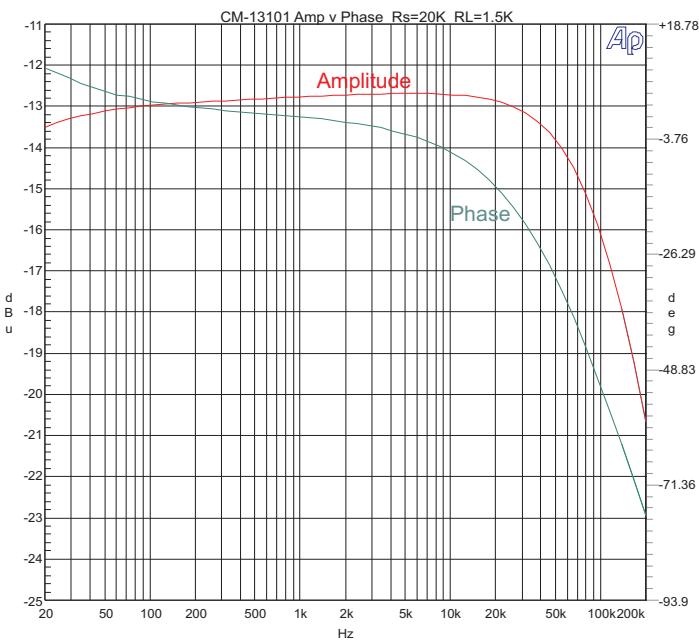

**Microphone Output Transformer  
9.0 : 1 (16.2K : 200) Step-down  
FET47 compatible**

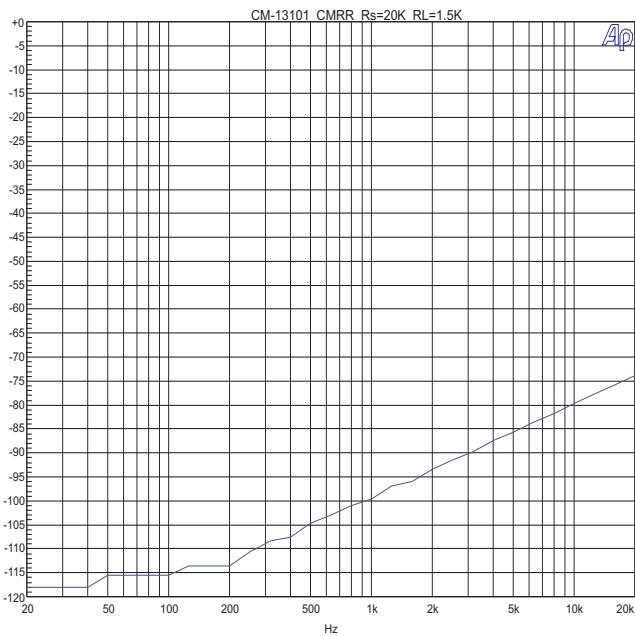

- Faraday shielding
- Good bandwidth (- 3 dB at 100kHz)
- Enriched harmonic characteristics

The CM-13101 was developed as a replacement transformer for Neumann FET47 style microphone circuits. Its distortion level is lower, but exhibits a similar THD at Fixed Frequency curve shape. It can be used with other microphone output circuit topologies requiring this turns ratio. It can be provided with other lamination choices, depending upon the designer's sonic preferences. Employing a hum-bucking design, its capability of rejecting stray magnetic interference is good.
